Precise, force-guided applications
Maximum precision for force-guided applications

Force-guided manufacturing processes, such as controlled joining, bending and insertion, as well as production tasks such as polishing and parts assembly, must all meet the highest standards of quality requirements. The force applied to a workpiece is always securely maintained to exact specified tolerances in order to prevent deformation or tiling.

Epson robots with force and torque sensors automate even the most challenging tasks with precise sensitivity. The sensors can accurately recognise the smallest of force changes and react accordingly. This means that robots integrated with imaging systems can handle sensitive components and achieve desired results.
The Force Sensor is installed between robot hand and end-effector, capturing both forces and torques in all three spatial directions and providing accurate measurement data to both the Epson robot controller and operator.

**Benefits at a glance:**

- Assure compliance with specified tolerances and pressing forces
- Avoid damage and wear to workpieces and machines
- Efficient automation of complex and challenging tasks
- Increased flexibility – without having to change device or taught positions
- Reduction of subsequent quality inspections and minimal corrections
Unique combination: sturdy and sensitive

The piezoelectric quartz crystal-based Epson Force Sensor applies a unique combination of high rigidity and sensitivity to ensure high force/torque recording in all six degrees of freedom – with extremely low noise sensitivity.

Sturdy

Epson Force Sensors are particularly robust and durable, with exceptional shock and temperature resistance. Even when operating at significant force and torque, the displacement of sensors is minimal.

High sensitivity

The digital noise in our sensors is extremely low compared to competitor products – at just 0.035N. This results in a measurement resolution of just 0.1 N with XYZ components, enabling forces to be captured with superior sensitivity.

**Digital noise**

- EPSON sensors: Exact measurement 0.1 N
- Competitors: 3 N
For use with various robots across a range of environments

Our force and torque sensors can be used with both 6-axis and SCARA robots, particularly the cleanroom version of C8 series robots, enabling them to perform across a wide range of applications and environments.
Efficient automation of demanding tasks

Force and torque sensors are a significant component for material testing, assembling, development and quality assurance. Their inherent accuracy, versatility and reliability means they are being widely adopted in today’s highly demanding manufacturing industry.

Precise screw tightening
Even the smallest screws can be tightened precisely with Epson force/torque sensors. There’s no need for extensive teaching as the robots are able to intuitively examine the force applied during the application.

Installation of components with reduced backlash
The installation of parts with low backlash, such as insertion of pins or transmission components, can now be automated. Due to the highly sensitive response of the Epson sensor, problems with tilted workpieces or jammed parts can be eliminated.

Inserting connectors
With Epson Sensors, insertion of connectors in various configurations can be automated. In the process the sensors detect misalignment between connector and socket by force effort and provide feedback to correct the alignment. The sensor’s high sensitivity allows the connector to be inserted in the socket with no damage.
Inserting electronic components with flexible wires

Our Force Sensors are ideally suited to the insertion of workpieces with unusual outer contours. One example is inserting electronic components with lead wires. Using the sensor, they can precisely locate the hole of the lead wire, and then route it without bending or damaging.

Polishing tasks

Even tasks such as polishing can be automated with consistency and accuracy, reproducing the desired force using the sensor.
Simple programming, real-time monitoring

The Epson RC+ 7.0 project management and development environment is ideal for the simple programming of your applications. Its intuitive Windows interface, open structure and integrated image processing and sensor control allow you to fully simulate the robot program and visualise robot movements in a 3D graphical environment.

Full Integration: Epson Force Editor and Force Monitor

The force sensors can be operated with ease via the Epson Force Editor and Force Monitor. The Epson SPEL+ robot language has robot commands that makes programming of robots and Force Sensors in the same environment seamless and convenient.
Even direct teaching of the Epson 6-axis robot is possible using the force/torque sensor or Teach Pendant (TP2). With minimal force effort, the robot arm can be moved manually in any direction within its working area using the gripper, allowing for fast and accurate results when teaching in a new application.

**System configuration examples**

- **Epson ProSix C8 series 6-axis robot**
  - Force Sensor S250L
  - Robot controller RC700-A
  - Manipulator ProSix C8
  - Force Controller FS1

- **Epson SCARA G series robot**
  - Force Sensor S2506
  - Manipulator G6
  - Force Controller FS1
  - Robot controller RC700-A

---

**Epson RC+ 7.0 features & benefits:**

Can run in Microsoft Windows XP, Windows Vista, Windows 7, Windows 8 and Windows 10

Integrated project management system allows fast project development

Communicates with the controller or multiple controllers via USB or Ethernet

Powerful and easy to learn SPEL+ programming language

Epson image processing and Epson Force Sensor are fully integrated in the user interface

- Wide-ranging port connection: Ethernet I/O, Profield, DeviceNet, Profinet, serial port, TCP/IP, I/O Handshake direct or available as an option
- Programming languages available in German, English, French, Japanese and Chinese
- Background tasks for complete system control
- Comprehensive Multi-Manipulator commands
- Integration of DLL functions
- Complete 3D simulator with import interface for 3D CAD files

About Epson

**Epson robot systems. Accurate, fast and reliable**

Our robots palletise, saw, mill, drill, grind, install, assemble and build together. They work with precision and at breathtaking speeds across a wide range of applications, often up to 24 hours a day.

Our product range includes one of the most comprehensive SCARA model ranges worldwide; 6-axis robots, controls and software.

**Realise the full potential of your Epson Robot systems**

We offer a comprehensive pre and after sales support programme as part of our service. This includes:

- Feasibility studies for maximum planning and project security
- Support during planning and implementation
- Introductory seminars, programming/maintenance courses and operator training
- Inspection and customised maintenance designs
- Customer service telephone service and on-site repair service
- Central spare part stocking

**Epson Spider robot**

The cost effective miracle
Due to its unique construction, the Epson Spider reaches every corner of its working area at unprecedented cycle times.

**Epson SCARA robots**

Available in over 400 versions, Epson SCARA robots are compact and powerful, delivering precise work even at high speeds.
Epson Robotic Solutions is one of the leading suppliers of high tech robot systems that are renowned worldwide for their reliability. The product range includes six-axis robots, SCARA robots, the SCARA entry-level LS and T models, the special Epson-developed Spider and N2 robots types, as well as the pioneering Dual Arm robot. Added to this are image processing controls and the Epson Force Sensor for force-controlled applications.

**Technological pioneer**

1982
Epson SCARA robots freely available in Japan for the first time

1986
First class 1 cleanroom robot

1997
First PC-based controller

2008
Inventor of the right or left arm-optimised G3 SCARA robot

2009
Inventor of the spider – a unique SCARA robot with no dead zones

2013
First application of Epson QMEMS® sensors in robotics, reducing six-axis kinematics vibrations

2014
Epson Compact Vision CV2: Epson’s own ultra-fast image processing computer

2016
Epson N2 series: World’s first 6-axis robot with folding arm - extremely compact and space-saving

2017
Epson Dual Arm robot with an arm geometry inspired by human physiology, as well as integrated sensors such as cameras, force sensors, and accelerometers

**Epson controls**

Maximum performance in the smallest of spaces. The Epson controllers are based on a robust, integrated system, and can control manipulators and peripheral devices.

**Epson 6-axis robot**

Flexibility through rotary-designed axes. Thanks to unprecedented point and path accuracy, complex work processes can be achieved with precision.
Experience all our Epson robots in action. Build, simulate and improve your automation application in a workshop cell, with help from our experts. The cell can be controlled and networked using all conventional fieldbus systems. In addition, we can supply you with modern peripherals such as a vision and conveyor tracking system.
